ABSTRACT:

PROBLEM TO BE SOLVED: To provide an authority delegating type service executing system not needing a confidential relationship between an intermediary system and a server system by proving a processing authority committed to the intermediary system from a user.

SOLUTION: An object system, service and intermediary agent certificate are prepared in an intermediary system 21, and an intermediary certificate is provided to the user 22 accessing to the intermediary system 21. An execution substitute is accepted by performing a user authentication by a user certificate and a commission provided by a permission of the user of the object system and service by a digital signature. The user certificate, the commission and the intermediary agent certificate are provided to the server system 23 as a substitute execution certification. The server system 23 embodies the service by verifying whether or not the commission is legitimate from the user certificate and the intermediary agent certificate.
